(54) Title: **PRESS-CONTACTING CONDUCTIVE TERMINAL DEVICE**

(57) **Abstract:** A press-contacting conductive terminal device comprises a non-conductive enclosure, a base, a contact member and a resilient member. The non-conductive enclosure defines a cylindrically shaped through hole. A front end and a rear end of the through hole having a first opening and a second opening, respectively. The contact member having a front end portion and a rear end portion, the rear end portion of the contact member and the resilient member being received in the through hole. One end of the resilient member abutting against the rear end portion of the contact member and the front end portion of the contact member extending through the first opening and beyond a front end of the non-conductive enclosure. The base including two side wings and a base portion, the base closing the second opening of the rear end of the through hole. The rear end of the

contact member being set between the two side wings of the base and the outer wall of the rear end of the contact member sliding within the inner walls and the two side wings. Thereby, the assembled press-contacting conductive terminal device omits the need for the previous metal shell, saving material, reducing weight, and saving cost.
